<b>6</b>	<b>Software Defined Network interfaces</b>	<b>16</b>
6.1	Open vSwitch . . . . .	16

# First Steps

---

Congratulations you are owning a TrustNode (TN), the fast, flexible FPGA-based routing platform made in Germany. In this section you will find any information to setup the device.

## 1.1 Flash the boot medium

If the TN is delivered without boot medium or you have to perform a full software update, flashing a USB-device or SD-card is needed. The archive where you found this manual contains also a compressed OS-image `trustnode*combined-uefi.img.gz`.

### 1.1.1 Linux – USB stick flashing

Congratulations, nearly done, just<sup>1</sup> type:

```
gunzip -c trustnode*combined-*.img.gz | sudo dd bs=1M of=/dev/XXX && sudo sync
```

If you need further information how to select the target device: see section 1.1.2.

### 1.1.2 Windows – USB stick flashing

First you have to extract the `trustnode*combined-*.img.gz` using you favourite tools e.g. 7zip. Now you can use a USB-stick flashing tool like ImageUSB<sup>2</sup> or Win32DiskImager<sup>3</sup> to get the image to USB-stick or SD-card.<sup>4</sup> If done, unmount<sup>5</sup> the medium.

Note: Windows will not be able to read the data written to the device. Windows GUI tools will not be able to delete the UEFI-boot partition if written to the bootmedium the first time. To reflash a bootmedium see here or install a Linux operating system and see Section 1.1.1.

---

<sup>1</sup>We assume you are know what you are doing InnoRoute is not responsible for any data loss on you system.

<sup>2</sup>[http://www.chip.de/downloads/ImageUSB\\_61096110.html](http://www.chip.de/downloads/ImageUSB_61096110.html)

<sup>3</sup><https://sourceforge.net/projects/win32diskimager/>

<sup>4</sup>This will delete any data on the chosen medium.

<sup>5</sup>Be sure that all data is written from the write buffer to the device itself.

### 1.1.3 UEFI-image BIOS settings

To boot-up the UEFI based images correctly, the following steps have to be applied to the BIOS-setup-utility of the CPU:

- After powerup press [ESC] and choose the "setup utility"
- Exit → load\_optimal\_defaults
- Advanced → consoleredirection → enable, 115200n8 (important!, if you forget, you will be blind)
- advanced → PCI → disable PCIe rootport 2-4
- boot → boot-type:uefi
- boot → set ACPI version to 4.0
- exit → save changes

Note: The UEFI image boot currently only from USB memorystick, SD-card is not supported.

## 1.2 Console connection

The root-shell is accessible over the microUSB port on the backside.<sup>6</sup> In some cases you have to install the FTDI-comport drivers<sup>7</sup>. The connection parameters are 115200 Baud 8N1, as printed on the backside of the TN.

## 1.3 SSH connection

SSHd is running at port 22, the root login is not permitted.

## 1.4 Login

Two logins are arranged:

- **root**:innoroot
- **TNuser**:innoroute

---

<sup>6</sup>Plug-in careful and use a strain-relief for free hanging cables.

<sup>7</sup><http://www.ftdichip.com/Drivers/VCP.htm>

## 1.5 Firstboot

To setup your board with the default settings, run:

```
/etc/init.d/TN_firstboot start
```

The firstboot-script is automatically launched if a new image is used the first time. The output is written to [/usr/share/InnoRoute/firstboot.log](#)

### 1.5.1 RSA key

A 4096bit RSA-key is automatically generated from the firstboot script and stored in [/root/.ssh](#) .

## 1.6 Using the Build environment

To generate a own TN firmware image, a build environment including a setup script is available here: <https://github.com/InnoRoute/TrustNodeWRT>.

### 1.6.1 Build environment setup

Please use an Debian<sup>8</sup> based host system with minimum 30 GB free space. The included setup script will download all required packages and setup an openwrt-based build environment. This will need some time, depending on the amount of cores in your build-system.

```
git clone https://github.com/InnoRoute/TrustNodeWRT TrustNodeWRT
cd TrustNodeWRT
./makeTrustNodeWRT.sh
#enter your root pwd (we need to install packages before)
#wait (get some coffe)
```

### 1.6.2 Build environment usage

Basic commands:

```
make menuconfig #shows the config menu, to select packages
make kernel_menuconfig #shows the config menu for the kernel
make -j8 V=99 #generated an image with a lot of log messages using 8 threads
```

If the build is successful, the imagefile can be found under `openwrt/bin/TrustNode-glibc/`, precompiled packages can be found in `openwrt/bin/TrustNode-glibc/packages`. (see Section 1.1.1 for flashing the Image.)

---

<sup>8</sup>suggestion: <https://xubuntu.org/getxubuntu/>

### 1.6.3 Updating the InnoRoute packages

To update the InnoRoute packages from the code-repository use the OpenWRT update environment:

```
cd openwrt
scripts/feeds update InnoRouteTN -a
scripts/feeds install -p InnoRouteTN -a
scripts/feeds install -p InnoRouteTN TrustNode
```

### 1.6.4 Include the packet repository into OpenWRT

This step is normally done by the TrustNodeWRT-setup-script. To include the InnoRoute package repository into an other openwrt instance, add the following line to the file `openwrt-folder/feeds.conf.default`:

```
src-git InnoRouteTN https://github.com/InnoRoute/packages.git
```

Now run the following commands from the OpenWRT-folder:

```
cd openwrt
scripts/feeds update InnoRouteTN
scripts/feeds install -p InnoRouteTN -a
scripts/feeds install -p InnoRouteTN TrustNode
make menuconfig
```

The new packages are now available in the *InnoRoute* section.

## 2.1 FPGA programming

The FPGA can be programmed via ftdi-JTAG or via ftdi-optomode(faster):

```
xc3sprog -c ftdi -v -p0 file.bit
TN_opto_prog file.bit
```

After programming the FPGA more information are available using the the status scripts described in Section 5.1.

## 2.2 Bitstream structure

Figure 1 gives an overview about the structure and implemented components in the TN bitstream<sup>9</sup>.

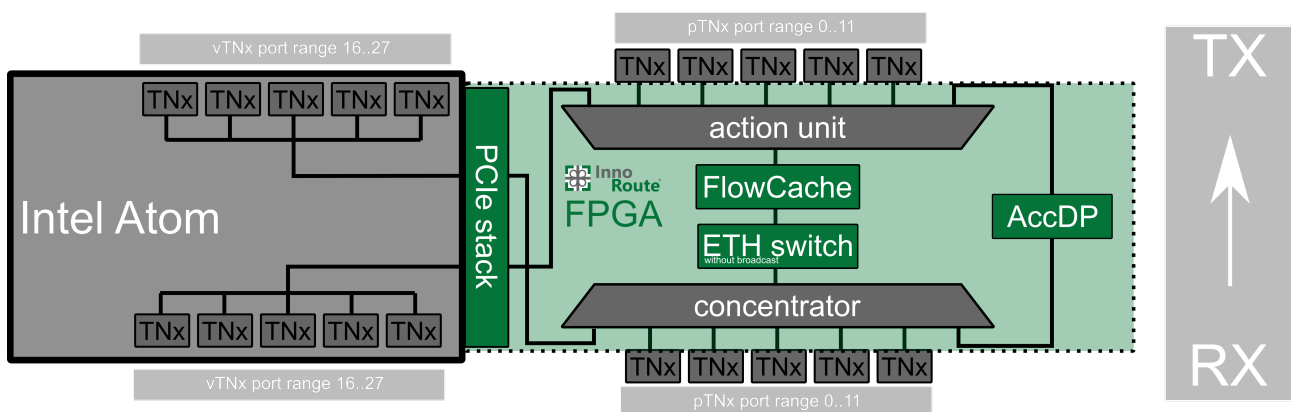

Figure 1: TrustNode bitstream structure

As shown in Figure 1, all physical ports of the device are available as virtual ports inside the Linux operating system. Packets which are forwarded to the Central Processing Unit (CPU) passing the whole chain of TN functions e.g. FlowCache and Ethernet switch before they are available on the internal TX ports. The FlowCache is chained after the Ethernet switch which means that this component can override decisions made by prior blocks. The acceleration datapath (AccDP) as a component which is not cut trough enabled, is also connected to internal ports of the design.

<sup>9</sup>This means the common bitstream, other implementation might contain more or a subset of the features.

## Trustnode PCIe-MMI-Driver

---

The memory mapped interface to the TN FPGA core is accessible using the following command:

```
TNbar1 offset value
TNbar1 0x123 #reads value at address 0x123
TNbar1 0x123 0xAA #sets value at address 0x123 to 0xAA
```

## Trustnode PCIe-Ethernet-Driver

---

### 4.1 /proc filesystem configuration

**/proc/TrustNode/TNsend2cpu** set the ll flag in every TX-descriptor and send the packets through the FPGA back to the CPU

**/proc/TrustNode/TN\_TXdbg** enables debug messages in TX path

**/proc/TrustNode/TN\_RXdbg** enables debug messages in RX path

## Embedded Linux

---

### 5.1 Usefull scripts

This section describes some of the scripts located in `/usr/share/InnoRoute/`. The scripts use the Memory Mapped Interface (MMI) described in Section 3.

<b>TN_beep.sh:</b>	Makes a acoustic signal.
<b>TN_buttons.sh:</b>	Polls status of frontpanel buttons.
<b>TN_clock.sh:</b>	Switches system clock source between Temperature-Controlled Crystal Oscillator (TCXO) and Phase Lock Loop (PLL).
<b>TN_fan.sh:</b>	Set fan speed.
<b>TN_fpga_status.sh:</b>	Display status information about loaded bitstream.
<b>TN_front_display.sh:</b>	Write data to front display.

<b>TN_gpio.sh:</b>	Write data to general purpose input/output (GPIO) header(inside the case).
<b>TN_led.sh:</b>	Write data to internal and Alaska-Physical Layer Chip (PHY)-LEDs.
<b>TN_nw_silent.sh:</b>	Silent Dynamic Host Configuration Protocol (DHCP)-client - and outgoing Address Resolution Protocol (ARP) messages.
<b>TN_pcie.sh:</b>	Rescan Peripheral Component Interconnect Express (PCIe) bus and display extended device information.
<b>TN_phy_dump.sh:</b>	Display status information about the PHY chips via Management Data Input/Output (MDIO).
<b>TN_phy_examples.sh:</b>	Example for MDIO write.
<b>TN_phy_init.sh:</b>	Initialising all PHYs via MDIO.
<b>TN_phy_reset.sh:</b>	Hard-resetting the Ethernet PHYs.
<b>TN_pll_dump.sh:</b>	Dumping PLL register contents.
<b>TN_pll_status.sh:</b>	Display PLL status information.
<b>TN_rgmii_phase.sh:</b>	Setting board-specific Reduced Gigabit Media Independent Interface (RGMII) input delays.
<b>TN_rgmii_status.sh:</b>	Display RGMII status information.
<b>TN_sys_ctrl_pmod.sh:</b>	Setting System Controller Peripheral Module (PMod) connection.
<b>TN_sys_ctrl_status.sh:</b>	Display status information from system controller.
<b>TN_time.sh:</b>	Set HW-clock.
<b>TN_version.sh:</b>	Display Hardware version information.

## 5.2 PLL

The AD9558 PLL chip can be accessed via SM-BUS `/dev/i2c-0`. The device address is `0x69`. InnoRoute provide a special tool to configure the PLL with a predefined configuration file. The configuration file can be created using the AD-Tool<sup>10</sup>. A example file can be found in `/usr/share/InnoRoute/`. The following command loads the `*.stp` config file to the PLL.

```
INRpload STP-file
#use parameter E to write the settings to the PLL-eprom
```

## 5.3 Sensors

Temperature, voltage and fan-speed probes are accessible via the `lm-sensors-tool`. The following command will list the available values of all sensors:

```
sensors
```

To change the sensors settings like `max_temp` or `crit_temp`, modify the file `/usr/share/InnoRoute/INRsenssor.conf` and write the values to the hardware using the following command:

```
sensors -c /usr/share/InnoRoute/INRsenssor.conf -s
```

## 5.4 Watchdog

The hardware watchdog is accessible via `/dev/watchdog0`.

## 5.5 I2C

Native I2C access is actually not provided by the firmware of the CPU-module.

---

<sup>10</sup><http://www.analog.com/en/design-center/evaluation-hardware-and-software/evaluation-boards-kits/eval-ad9558.html>

## 5.6 SM-Bus

The SM-Bus is accesable via `/dev/i2c-0`

## 5.7 Real Time Clock

The RTC is accesable via `/dev/rtc0`. Use the following comands to configure:

```
hwclock -w #write systeme time into HW-clock
date -s "2013-11-19 15:11:40" #set system-time
```

## 5.8 FTDI eeprom

To initialise the ftdi-eeprom use the following comand:

```
INR_ftdi_eeprom -p 0x6010 -v 0x0403 -M
```

## 5.9 Network configuration

In default state, the device is configured as DHCP client at interface `eth0`<sup>11</sup>. The configuration can be changed by manipulating the file `/etc/config/network`. If a bitstream with PCIe-network-interfaces is loaded the TN interface driver is loaded automatically on start up and the Interfaces `TN0` to `TNx` will appear automatically. Image versions higher or equal then v1.0 Open vSwitch (OVS) is used for internal network configuration, see Section 6.1 for more information.

## 5.10 Software packet management

For packet management the `opkg` packet manager is used to install or update an provided `*.ipkg` file use the following command:

```
opkg install <PACKETFILE>
```

---

<sup>11</sup>which can be a external attached USB network adapter

## 5.11 FPGA mode changing

The FPGA can be configured with several bitstreams to achieve different behaviours. This configuration is handled using the software `TNmodchange`, the last used configuration is automatically saved and loaded at next bootup. Please use the following command to change the FPGA configuration<sup>12</sup>:

```
TNchangemod <modus>
# 0:disabled
# 1:6Tree
# 2:Acceleration Datapath
# 3:Ethernet swiching
# 4:Displaytest and loopback
# 5:Atom-FPGA control interface
# 6:Flowcache
# 7:Combined Bitstream
```

The actual configuration is stored in the file `/usr/share/InnoRoute/TNmod.conf`, changes will applied after reboot.

## 5.12 FlowCache

The Flowcache is a part of the InnoRoute datapath (DP) which supports flow-classification in hardware. The hardware implementation depends on several tables for full and wildcard based matching L2 and L3 flows. A structural description of the FlowCache and its components can be found in the FlowCache documentation. A overview over the internal components structure is provided in Figure 1. The software tool `TNflowtable` helps to address the different flow table implementations and automatically select the best table for the provided information. Available flowtables:

<b>EMH action table:</b>	Matching for full L2 or L3 field stack.
<b>EMH hash table:</b>	Hash table for EMH rule table.
<b>EMH collision table:</b>	Backup table for EMA hash collisions.
<b>EMA action table:</b>	Matching for selectable L2 or L3 field stack.
<b>EMA hash table:</b>	Hash table for EMA rule table.
<b>Action table:</b>	Table for storing Actions.
<b>Mastertable:</b>	Software table, flows are automatically distributed to the hardware tables.

---

<sup>12</sup>This is an example configuration, the bitstreams included in your image may be different.

Supported match fields are:

- MAC\_SRC
- MAC\_DST
- VLAN
- ETHERTYPE
- IPv4\_SRC
- IPv4\_DST
- L4\_PROTO
- TCP/UDP\_SRC
- TCP/UDP\_DST
- VLAN\_PRIO
- TOS
- PHY\_INPORT

The following commands are used to configure the Flowtables:

```
TNflowtable RuleT_EMH_add [options] #add to EMH rule table
TNflowtable HashT_EMH_add [options] #add to EMH hash table
TNflowtable CollT_EMH_add [options] #add to EMH collision table
TNflowtable RuleT_EMA_add [options] #add to EMA rule table
TNflowtable HashT_EMA_add [options] #add to EMA hash table
TNflowtable ActT_add [options] #add to actiontable
TNflowtable add [options] #add to mastertable and add to EMA, EMH or EMH_CollT and ActT
TNflowtable print -i2 -c10 #print mastertable from item 2 to 12
TNflowtable --help #show all options
```

Adding a flow to the Mastertable with `TNflowtable add -C5.6.7.8 -T1.2.3.4 -O1` will automatically configure the hardware Tables to match both IP-address fields and forward the packet to output port #1. To use the flowcache, the associated bitstream has to be selected as described in Section 5.11.

#### 5.12.1 Resetting the FlowCache

If for some reasons all flows have to be wiped from the hardware flow tables:

```
TNchangemod 7 #reload the hardware bitstream
rm /tmp/INR_FC* #remove all shadow memory files
```

#### 5.12.2 FlowCache kernelmodule

coming soon...

### 5.12.3 FlowCache example commands

Table 1: FlowCache example commands

Command	Match	Action
TNflowtable add -I1 -O2	all packets from port #1	forward to port #2
TNflowtable del -I1 -O2	all entry's matching the pattern	delete entry
TNflowtable add -I0 -O16	all packets from port #0	forward to CPU port TN0
TNflowtable ActT_add -i0x155 -b1	all packets not matching a other <sup>13</sup> rules in the FlowCache <sup>14</sup>	drop (set bad=1)
TNflowtable ActT_del -i0x155	action table entry 0x155	delete entry
TNflowtable ActT_print -i0x155 -c10	print 10 entrys of the action table beginning with position 0x155	
TNflowtable add -T192.168.0.1 -O16	all packets with dst_ip=192.168.0.1	forward to port #16 (Port #16 is the TN0 interface inside Linux.)

### 5.12.4 Disable hardware Ethernet switch

To forward every packet from the external front connectors directly to the CPU, apply the following commands to the FlowCache:

```
TNflowtable add -I0 -O16
TNflowtable add -I1 -O17
TNflowtable add -I2 -O18
TNflowtable add -I3 -O19
TNflowtable add -I4 -O20
TNflowtable add -I5 -O21
TNflowtable add -I6 -O22
TNflowtable add -I7 -O23
TNflowtable add -I8 -O24
TNflowtable add -I9 -O25
TNflowtable add -I10 -O26
TNflowtable add -I11 -O27
```

<sup>14</sup>This entry can be used to overrule decisions made by the hardware Ethernet switch.

<sup>14</sup>-i specifies the position in a table to start with the search for a free position. To address a special table ID e.g. 0x155 ensure with the print command that table position 0x155 is free. Otherwise the entry will be stored at the next free space which can be e.g. 0x116.

## 5.13 TNflowdump

The tool **TNflowdump** implements a lightweight connection between the OVS flowtables and the flowcache which is described in Section 5.12. The python script **TNdumpflow.py** is located in `/usr/share/InnoRoute/scripts/`. The script listen to all changes applied to a specified OVS bridge and adopt all changes to the entries of the flowcache. The monitored bridge can be specified in the configuration file `/usr/share/InnoRoute/TNflowdump.conf`. **TNflowdump** can be activated/deactivated using the init script `/ect/init.d/TN_flowdump`.

## Software Defined Network interfaces

---

### 6.1 Open vSwitch

The Open vSwitch, running on the Atom processor, provides a open flow interface. Further documentation is available under <http://openvswitch.org> . To add a OpenFlow controller to the preconfigured OVS run the following command:

```
ovs-vsctl set-controller TNbr tcp:<IP_ADDR>
```

Note that the hardware Ethernet switch have to be overwritten to forward all traffic to the OVS, see Section 5.12.4.

## Acronyms

---

<b>AccDP</b>	acceleration datapath
<b>ARP</b>	Address Resolution Protocol
<b>CPU</b>	Central Processing Unit
<b>DP</b>	datapath
<b>DHCP</b>	Dynamic Host Configuration Protocol
<b>EMH</b>	EXACT MATHING WITH HARDCODED FIELDS
<b>EMA</b>	EXACT MATHING WITH ARBITRARY FIELDS
<b>FPGA</b>	Field Programmable Gate Array
<b>GPIO</b>	general purpose input/output
<b>JTAG</b>	Joint Test Action Group
<b>L2</b>	OSI layer 2
<b>L3</b>	OSI layer 3
<b>MMI</b>	Memory Mapped Interface
<b>MDIO</b>	Management Data Input/Output
<b>OVS</b>	Open vSwitch
<b>OSI</b>	Open Systems Interconnection
<b>OS</b>	Operating System
<b>PCIe</b>	Peripheral Component Interconnect Express
<b>PHY</b>	Physical Layer Chip
<b>PMod</b>	Peripheral Module
<b>PLL</b>	Phase Lock Loop
<b>RSA</b>	Rivest, Shamir und Adleman
<b>RGMII</b>	Reduced Gigabit Media Independent Interface
<b>RTC</b>	Real Time Clock
<b>SDN</b>	Software Defined Network
<b>SD</b>	Secure Digital
<b>TCXO</b>	Temperature-Controlled Crystal Oscillator
<b>TN</b>	TrustNode
<b>UEFI</b>	Unified Extensible Firmware Interface
<b>USB</b>	Universal Serial Bus
